

INTERNATIONAL GLOBAL SHORTWAVE CLUB

May 6, 2023

Dear Global Shortwave Club member:

Have you ever heard of a Ferrite Sleeve Loop antenna? Shortwave enthusiasts have based recent experimentation on the premise that even a small FSL antenna can run wild when it is in the right place at the right time; its portability and quick setup nature become its primary advantages over other types of antennas.

Some experimented by building monster FSL antennas, but it quickly became clear it was unnecessary because even modest-sized FSLs (from 4 to 6 inches) can be highly effective if they have the advantage of excellent propagation.

The FSL antenna's portability, quick setup, and rugged survival give it a critical edge in harsh or wild environments like Alaskan snowfields or ocean-side cliffs - and since even modest-sized FSLs can run wild when conditions are great, the current mindset is to enhance portability by making the antennas lean, mean and capable of surviving any nasty weather.

Since the mission is to create an antenna to survive the worst storms, many have taken this challenge to make their FSL indestructible. More on that next time...

Good listening!
